

# Introduction

This paper studies multi-page document annotation.

The central claim is that anchors can be linked across pages.

See Figure 1 below for the overall architecture.

[ Figure 1: architecture diagram placeholder ]

# Methods

We extend the annotation tool with a unified anchor model.

Each anchor is a text span or a region on a page.

Links reference anchors by id, so any pair can be connected.

[ Table 1: dataset statistics placeholder ]

# Results and Conclusion

The results confirm the hypothesis stated in the Introduction.

Annotators linked claims on page 3 back to Figure 1 on page 1.

This validates cross-page linking end to end.

We conclude that unified anchors enable rich PDF annotation.
